

## How to root plants in water

Things to remember when rooting plants in water:

1. Make a clean cut with scissors or pruning sheers
2. Remove 50% of foliage
3. Use any container that can hold water
4. Use filtered water when available
5. Remember to remove any rotted cuttings and change the water often.
6. Vine plants can be rooted in water and left permanently in water.
7. Woodier plants can be rooted in water and should moved to soil at the fist signs of root growth
